

The results from the York University analysis of the canisters collected on board the TVA Twin Otter are cataloged with a York number that is associated with the can itself and a TVA sample ID that is logged on the TVA on board data logger. The TVA sample ID's are integer numbers that count upward from 1 at the beginning of the SETTS project and continue through the NETTS project. The TVA ID's are presented in both the Excel sheet of information which includes the flight number, collection date and time, location, altitude and in the table of the analytical results from the York University laboratory that analyzed the canisters. So to select a canister for a particular flight and collection time/location simply look up the corresponding TVA ID on the HC analytical results worksheet.
